MONOSPACED FONTS WERE WIDELY USED IN EARLY COMPUTERS AND COMPUTER TERMINALS, which often had extremely limited graphical capabilities. Hardware implementation was simplified by using these early systems a text mode where the screen layout was addressed as a regular grid of tiles, each of which could be set to display a character by indexing into the hardware's character text editors employ map. Some systems

allowed colored text to be displayed typeface. This by varying the foreground and background color for each tile. Other effects included reverse video and blinking text. Nevertheless, were typically limited to a single console font. Even though computers can now display a wide variety of fonts, the majority of IDEs and software

Monospaced fonts are also used in terminal emulation and for laying out

tabulated data in plain text documents. In technical manuals and resources for programming languages, a monospaced font is distinguish code from naturallanguage text. It is also used in disassemblers when it outputs the information when an instruction have been executed sorted in columns so that they line up vertically.
